What is Intermittent Catheterisation?

Intermittent catheterisation is a simple procedure which you can perform yourself to empty your bladder. It involves the temporary insertion of a small, clean, hollow tube, called a catheter, into the urethra (this is the opening to the bladder) which is removed once the urine is drained.

Intermittent catheterisation may be recommended when the bladder does not empty properly, to reduce the risk of kidney damage and urinary tract infections, or it may be used to dilate the urethra for people with urethral strictures.

People who use intermittent catheterisation as a method of emptying their bladder may need to do this up to four to six times a day. Your healthcare professional will advise you how often you need to catheterise and how much fluid you should drink.

Supplies can be carried discreetly in your pocket or bag, and the procedure can be done fairly quickly. To learn the procedure you must know where the catheter is inserted and how to use the product. You must also be able to reach your urethra and be able to manipulate the catheter.

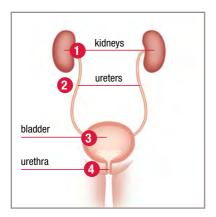

You can drain the urine through the catheter and into the toilet or you may prefer to use a receptacle.

Intermittent Catheterisation is easy to learn for people of all ages.

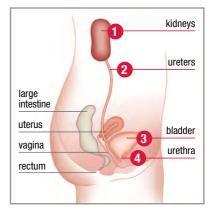

The procedure can also be performed by a caregiver or family member if you are unable to perform the procedure yourself.

This booklet is designed as a guide to supplement the information and care given by your healthcare professional. It is not designed to replace it.

How the Urinary System Works

- Urine is produced by the kidneys, which filter out the waste products of your body.
- The liquid waste is passed via tubes called ureters to your bladder, the organ that stores urine.
- When the bladder becomes full, a signal is sent to the brain to tell the urethral sphincter muscle to relax and the bladder to contract.
- Urine flows down the urethra, the natural tube through which urine exits the bladder, and out of the body.

Self-Intermittent Catheterisation (SIC)

When the bladder does not empty on its own, SIC may be recommended. It involves using a catheter to drain urine from your bladder via the urethra. Urine should be expelled on a regular basis throughout the day to keep the body healthy.

Apogee Intermittent Catheter

Wash hands with mild soap and water. Apply lubrication to catheter on the end with drainage eyelets (see below).

With one hand, spread the labia. Wash the area around the urethral opening above the vagina thoroughly with soap and water, or a towelette.

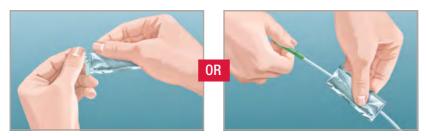

With your other hand ensure the catheter funnel, or open end, is directed into the toilet or collection receptacle. Insert the catheter into the urethral opening.

When urine drainage is complete, slowly remove the catheter and discard properly. Wash hands.

How to Lubricate a Catheter

Tear off top of lubricant packet (or open tube of lubricant) and apply lubricant to the tip and along the length of the catheter. Take care not to touch tip of catheter.

Tear off each end of the lubricant packet, insert catheter through the packet, and slide hack and forth

Scan the OR code to view the instructional video, or visit hollister.com.au and type in the word 'Apogee'.

Cautions & Warnings

- · Single-use catheter
- · Ready to use with pre-lubricated gel*
- . Not made with natural rubber latex
- 2 Ultra-smooth catheter eyelets
- · Colour-coded funnel

INDICATIONS FOR USE: This intermittent catheter is a flexible tubular device that is inserted through the urethra by male, female and paediatric patients who need to drain urine from the bladder.

WARNING: To help reduce the potential for infection and/or other complications, do not reuse. Do not use if package is damaged or opened. If discomfort or any sign of trauma occurs, discontinue use immediately and consult your healthcare professional.

PRECAUTION: Please consult a healthcare professional before using this product if any of the following conditions are present: Severed urethra, unexplained urethral bleeding, pronounced stricture, false passage, urethritis - inflammation of the urethra, prostatitis - inflammation of the prostate gland, epididymitis - inflammation of the epididymis (testicle tube). Self-catheterisation should follow the plan of care and advice given by your healthcare professional and be carried out only in accordance with the instructions for use provided. Because catheterisation frequency varies by person, the recommended frequency of your catheterisation should be provided by your healthcare professional. For any other questions about your catheterisation, please contact your healthcare professional.

NOTE: Store boxes in a flat position and at normal room temperature.

CAUTION: Prior to use, be sure to read the Instructions for Use for information regarding Intended Use, Contraindications, Warnings, Precautions, and Instructions.

Hollister Learning Centre

Hollister has a Learning Centre for anyone looking for more information on Continence Care

Information at your fingertips.

Whether you're wondering about neurogenic bladder, how the urinary system works, or what an intermittent catheter is – these resources are for you. Here, you'll find answers to lifestyle questions, learn what's new, and discover lots of information that will help you live well.

Frequently Asked Questions

Intermittent Catheterisation

Q What are the typical signs of infection in the kidneys or bladder?

A You may feel feverish, have lower loin pain or pain in your back. The urine may have an offensive odour, and may be cloudy. Blood may be present in the urine. Frequency of urination and pain, burning or stinging sensation on passing urine may be present. You may also feel confused. Not everyone develops these symptoms. If you are not feeling well or you suspect you have an infection, contact your healthcare professional. It is important to contact your healthcare professional at the first sign of a urinary infection.

O How much fluid should I drink?

A It is generally recommended that adults drink approximately 2 litres of fluid each day. Your needs may be different, so please be sure to follow your healthcare professional's advice. Check your weight as well to determine if you are retaining fluid. Your recommended fluid intake may be based on your weight and other medical history.

Q What should I do if I cannot pass the catheter into my bladder?

A If you cannot pass the catheter after 3 or 4 attempts, call your healthcare professional or visit your local emergency department. Never force the catheter as you could cause injury to the urethra.

Q Why do I have large amounts of urine when I catheterise at night?

A Please consult your healthcare professional regarding this situation.

Q What steps do I need to take to prepare to catheterise?

- A Proper hand washing and personal hygiene are important steps in preparation for catheterisation.
 - 1 Wash hands with mild soap and water and dry thoroughly
 - 2 Cleanse the glans and the opening of the urethra with mild, unscented soap or a non-alcoholic wet wipe.

Q How do I dispose of the catheter?

A Catheters should be disposed of in a waste bin. Do not flush it down the toilet. Follow any local guidelines for the disposal of waste, especially medical devices.

Q What features should a catheter have?

A Desirable features include the following: Catheter material that is biocompatible (does not cause allergic reactions), flexible, to accommodate the urethral contours, and durable so that it retains its shape even with temperature variations. It should also provide atraumatic (gentle and comfortable) insertion, be ready to use, easy to handle, and enable the user to apply a "no-touch" technique to help reduce the risk of infection.

Lifestyle

Q How do I catheterise on a trip?

A In many cases, planes, buses and trains do not have wheelchair accessible bathrooms. You may choose to catheterise under a blanket using a closed system catheter like the VaPro Plus Pocket No Touch intermittent catheter.

Q How should I prepare for a trip?

A Check with the airline when making travel arrangements for special accommodations (i.e., ask for assistance to board the plane if needed, request a larger bag allowance). You should also familiarise yourself with the policies of your airline. Alert hotels about your needs before your arrival and request any equipment you will need (i.e., tub, bench, roll-in shower, etc). Even cruise lines must provide handicap accessible rooms. Be very specific about what you need when making reservations. Research your travel destination to prevent surprises with regard to physical barriers. Be sure to carry your medications and supplies for catheterisation and other self-care routines in your carry-on luggage. Get as much rest as possible, maintain your usual care routines, and drink plenty of fluids. Drink bottled water if the tap water is questionable.

Q What do I need to carry with me to catheterise away from home?

A While the need for supplies varies by individual, ensure that you have enough catheters to use during your time away from home, any supplies needed for proper cleansing, and a bag to dispose of your catheters if you are not able to locate a waste bin.

Bladder Diary

Important – please read carefully

It is important that you fill in the chart on the next page to monitor your progress with intermittent catheterisation. It is designed to give an idea of your average fluid intake, urine output and any leakage during the day. This is important to your healthcare professional.

Each day, record how much you drink (see pictures below for a guide of how many mls) and when you drink it (put the volume in the box provided for that time). If you often drink from the same or similar sized cups, then you need only measure how much it holds once and put that value down every time you drink from it, otherwise use our guide for the amount in mls.

When you go to the toilet, measure the urine you pass using a small jug. Record the volume in mls. Record it in the box next to the nearest hour in the 'out' column.

When you use the catheter, measure the amount of urine drained and place in the column marked 'catheter'.

When you go to bed put a 'B' on the chart next to the right time, so that we can tell how many times you have to get up at night to pass urine.

If you are unable to fill the chart in properly every day because of other commitments, please try to fill it in accurately for at least 2 days by measuring and recording the frequency of passing urine and leaking by ticking the correct boxes for the remaining days.
